Polar Bear

The Polar bear's physical characteristics help it survive in its habitat. Polar bears fur is very light white. From the polar bears fur it has camouflage. Polar bears skin is black not white. The polar bear can weigh up to 1600 pounds. This is how the polar bear survives in the arctic.

The food the polar bear eats helps it survive in its habitat.

Polar bears eat seals and walruses.

For polar bears fat is good for them

to eat. Polar bears eat carrion and

narwhals. Polar bears eat grass and

berries. Polar bears eat beluga

whales. These foods help the

polar bear survive in the

Arctic.

The polar bears shelter helps it survive in its habitat. Polar bears can live in its habitat when the weather is 50°F below zero. Many polar bears live in the southern part of the Arctic. Also, some polar bears live in the north pole which is still in the Arctic. They can even live in Greenland (which is really icy) and polar bears can live in Canada and Norway. This home helps the polar bear survive in the Arctic.
